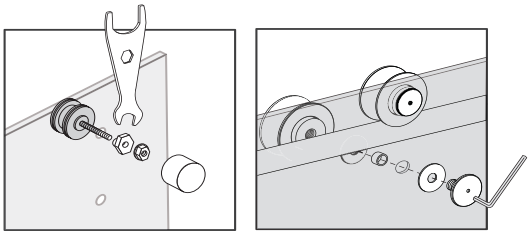
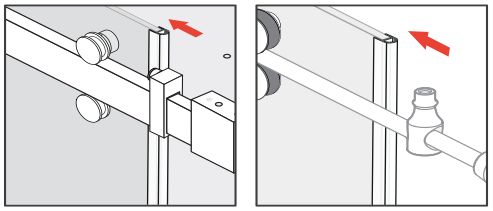
ROLLERS

Checking rollers and attachment to make sure they are not loose or damaged. Adjust and tighten as illustrated in installation instructions for the system you purchased.

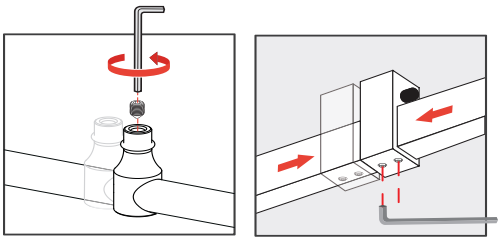


BUMPER SEAL FOR SYSTEM (CASCADE/DRIFT/BASIN)

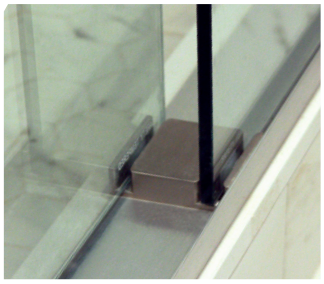
Make sure these gaskets are not missing so the shower can properly seal as well as deter damage due to contact with surrounding substrates.



STOP INSTALLATION (DRIFT/BASIN) Stops need to be installed in such a manner that the glass does not contact the wall before the stop is engaged. Stop should be installed so there is a minimum of 1" clearance between handle and glass to avoid impact.

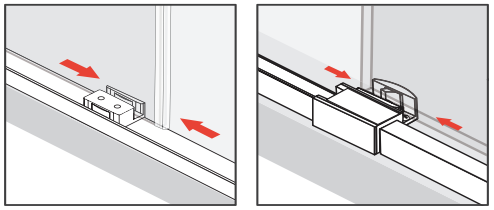


If stops are moved to improper locations they should be adjusted back into proper location and tightened per the installation instructions for the system you purchased.



GLASS CLEARANCE AT BOTTOM

If the glass is very close or dragging on the base of the shower it requires roller adjustment to move the glass a safe distance away from the curb or floor. Refer to installation instructions to properly adjust.



ANYTHING MISSING OR LOOSE?

All components of the complete shower system are critical to safe and reliable operation. If your shower is missing any component please contact us immediately for replacement parts to bring the shower into proper working order. Track systems or fixed perimeter metal systems that have become loose from the wall to which they are anchored should be investigated and secured immediately.
